<u>FIRST TASK:</u>

We would like you to create a very simple booking system, please see the attached screenshots.

The first screen has a dynamic list of grades that has to be fetched remotely, the user can choose one or multiple days and a time range. Clicking on "Create Bookings" will take the user to the second screen.

The second screen shows a list of bookings to be created based on the date and times selected in the previous screen and staff available for each booking.

<u>Instructions:</u>

- The list of grades must be fetched remotely from https://static.healthforcego.com/grades.json

- Clicking on "Create bookings" on the first screen should retrieve a list of available staff but for this task you will generate them randomly.

- Clicking on "Confirm bookings" on the second screen should post the data to a server, but for this task you will print to console.log the data.

<u>Deliverables:</u>

- Use of React components.

- Use of state management.

- Some unit testing if possible.

- Feel free to use any framework or library you want, and enhance it as much as possible
